LoanTap - ML CaseStudy

Logistic Regression

Analysed by : **Pavan Eleti**

Introduction:

Loantap is a leading financial technology company based in India, specializing in providing flexible and innovative loan products to individuals and businesses. With a focus on customer-centric solutions, Loantap leverages technology to offer hassle-free borrowing experiences, including personal loans, salary advances, and flexible EMI options. Their commitment to transparency, speed, and convenience has established them as a trusted partner for borrowers seeking efficient financial solutions.

- LoanTap is at the forefront of offering tailored financial solutions to millennials.
- Their innovative approach seeks to harness data science for refining their credit underwriting process.
- The focus here is the Personal Loan segment. A deep dive into the dataset can reveal patterns in borrower behavior and creditworthiness.
- Analyzing this dataset can provide crucial insights into the financial behaviors, spending habits, and potential risk associated with each borrower.
- The insights gained can optimize loan disbursal, balancing customer outreach with risk management.

Our Task:

- > As a data scientist at LoanTap, you are tasked with analyzing the dataset to determine the creditworthiness of potential borrowers. Your ultimate objective is to build a logistic regression model, evaluate its performance, and provide actionable insights for the underwriting process.

Features of the dataset:

- Column Profiling:

Feature	Description
loan_amnt	The listed amount of the loan applied for by the borrower. If at some point in time, the credit department reduces the loan amount, then it will be reflected in this value
term	The number of payments on the loan. Values are in months and can be either 36 or 60
int_rate	Interest Rate on the loan
installment	The monthly payment owed by the borrower if the loan originates
grade	LoanTap assigned loan grade
sub_grade	LoanTap assigned loan subgrade
emp_title	The job title supplied by the Borrower when applying for the loan
emp_length	Employment length in years. Possible values are between 0 and 10 where 0 means less than one year and 10 means ten or more years
home_ownership	The home ownership status provided by the borrower during registration or obtained from the credit report
annual_inc	The self-reported annual income provided by the borrower during registration
verification_status	Indicates if income was verified by LoanTap, not verified, or if the income source was verified
issue_d	The month which the loan was funded
loan_status	Current status of the loan - Target Variable
purpose	A category provided by the borrower for the loan request
title	The loan title provided by the borrower
dti	A ratio calculated using the borrower's total monthly debt payments on the total debt obligations, excluding mortgage and the requested LoanTap loan, divided by the borro
earliest_cr_line	The month the borrower's earliest reported credit line was opened
open_acc	The number of open credit lines in the borrower's credit file
pub_rec	Number of derogatory public records
revol_bal	Total credit revolving balance
revol_util	Revolving line utilization rate, or the amount of credit the borrower is using relative to all available revolving credit
total_acc	The total number of credit lines currently in the borrower's credit file
initial_list_status	The initial listing status of the loan
application_type	Indicates whether the loan is an individual application or a joint application with two co-borrowers
mort_acc	Number of mortgage accounts
pub_rec_bankruptcies	Number of public record bankruptcies
Address	Address of the individual

```

	Total	Percent
mort_acc	37795	9.543469
emp_title	22927	5.789208
emp_length	18301	4.621115
title	1756	0.443401
pub_rec_bankruptcies	535	0.135091
revol_util	276	0.069692

Insight

> Following columns has missing values
>
> 1. emp_title has 5.78% missing values
> 2. emp_length has 4.62% missing values
> 3. title has 0.44% missing values
> 4. revol_until has 0.06% missing values
> 5. mort_acc has 9.54% missing values
> 6. pub_rec_bankruptcies has 0.13% missing values

> Action

- Since ML algorithm do not work on columns which has missing values so we need to impute these missing values.

```

💡 Insights:

1. The analysis suggests a prevalence of outliers, prompting further investigation into outlier detection techniques.
2. Among the numerical features, Potential outliers may still be present.
3. Notably, features such as Pub_rec, Mort_acc, and Pub_rec_bankruptcies display a sparse distribution of unique values, indicating the potential benefit of generating binary features from these variables.

```

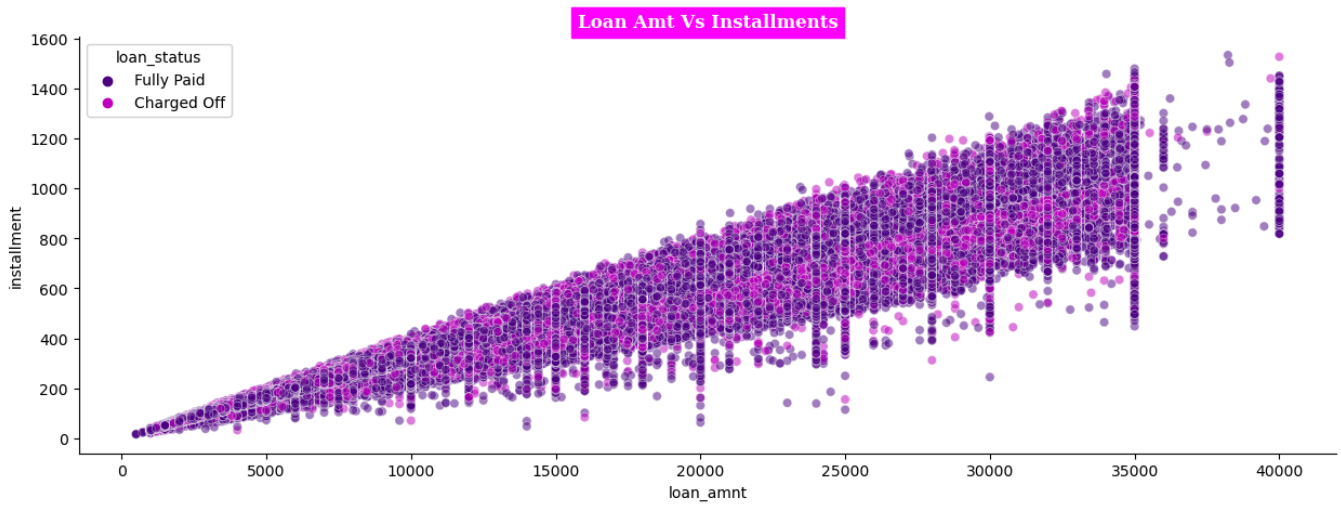
Q2. Comment about the correlation between Loan Amount and Installment features.

```
df[['loan_amnt', 'installment']].corr()
```

	loan_amnt	installment
loan_amnt	1.000000	0.953929
installment	0.953929	1.000000

```
plt.figure(figsize = (15,5))
sns.scatterplot(data = df, x = 'loan_amnt', y = 'installment', alpha = 0.5, hue = 'loan_status', palette = cp)
plt.title('Loan Amt Vs Installments',fontsize=12,fontfamily='serif',fontweight='bold',backgroundcolor=cp[3],color='w')
sns.despine()
plt.show()
```



Insights:

The correlation coefficient measures the strength and direction of the linear relationship between two variables. In this case, the correlation coefficient between 'loan_amnt' and 'installment' is quite high, approximately 0.95, indicating a strong positive linear relationship between these two variables.

- **Loan Terms**: Understanding the relationship between loan amount and installment payments is crucial for setting appropriate loan terms. Lenders can adjust loan terms such as interest rates and repayment periods based on the borrower's ability to handle installment payments associated with different loan amounts.
- **Potential Multicollinearity**: When building predictive models, it's essential to be cautious of multicollinearity between highly correlated predictor variables. Multicollinearity can lead to unstable estimates and difficulties in interpreting the model coefficients. Therefore, it might be necessary to address multicollinearity through techniques such as variable selection or regularization.

Q3. The majority of people have home ownership as ___.

```
(df['home_ownership'].value_counts(normalize=True)*100).to_frame()
```

home_ownership	proportion
MORTGAGE	50.084085
RENT	40.347953
OWN	9.531096
OTHER	0.028281
NONE	0.007828
ANY	0.000758

Insights:

- Mortgage holders comprise the majority with approximately `50.08%`, indicating that a significant portion of individuals own homes through `Mortgage` agreements.
- `Renters` constitute a substantial portion, accounting for around `40.35%` of home ownership types. This suggests a sizable demographic of individuals who opt for renting rather than owning a home.

Q4. People with grades ‘A’ are more likely to fully pay their loan. (T/F)

```
pd.crosstab(df['grade'],df['loan_status'], normalize = 'index')
```

loan_status	Charged Off	Fully Paid
grade		
A	0.062879	0.937121
B	0.125730	0.874270
C	0.211809	0.788191
D	0.288678	0.711322
E	0.373634	0.626366
F	0.427880	0.572120
G	0.478389	0.521611

💡 Insights:

> - `True` . **Grade 'A' borrowers demonstrate a significantly high likelihood of fully repaying their loans, with approximately 93.71% of loans being fully paid**. This suggests that borrowers with the highest credit rating are more inclined to fulfill their loan obligations successfully.
> - The proportion of charged-off loans for grade 'A' borrowers is relatively low, standing at approximately 6.29%. This indicates a low default rate among borrowers with the highest credit rating, emphasizing their creditworthiness and reliability in loan repayment.

🪚Q5. Name the top 2 afforded job titles.

```
df[df['emp_title'] != 'No Employee Title']['emp_title'].value_counts().to_frame().head()
```

	count
emp_title	
Teacher	4389
Manager	4250
Registered Nurse	1856
RN	1846
Supervisor	1830

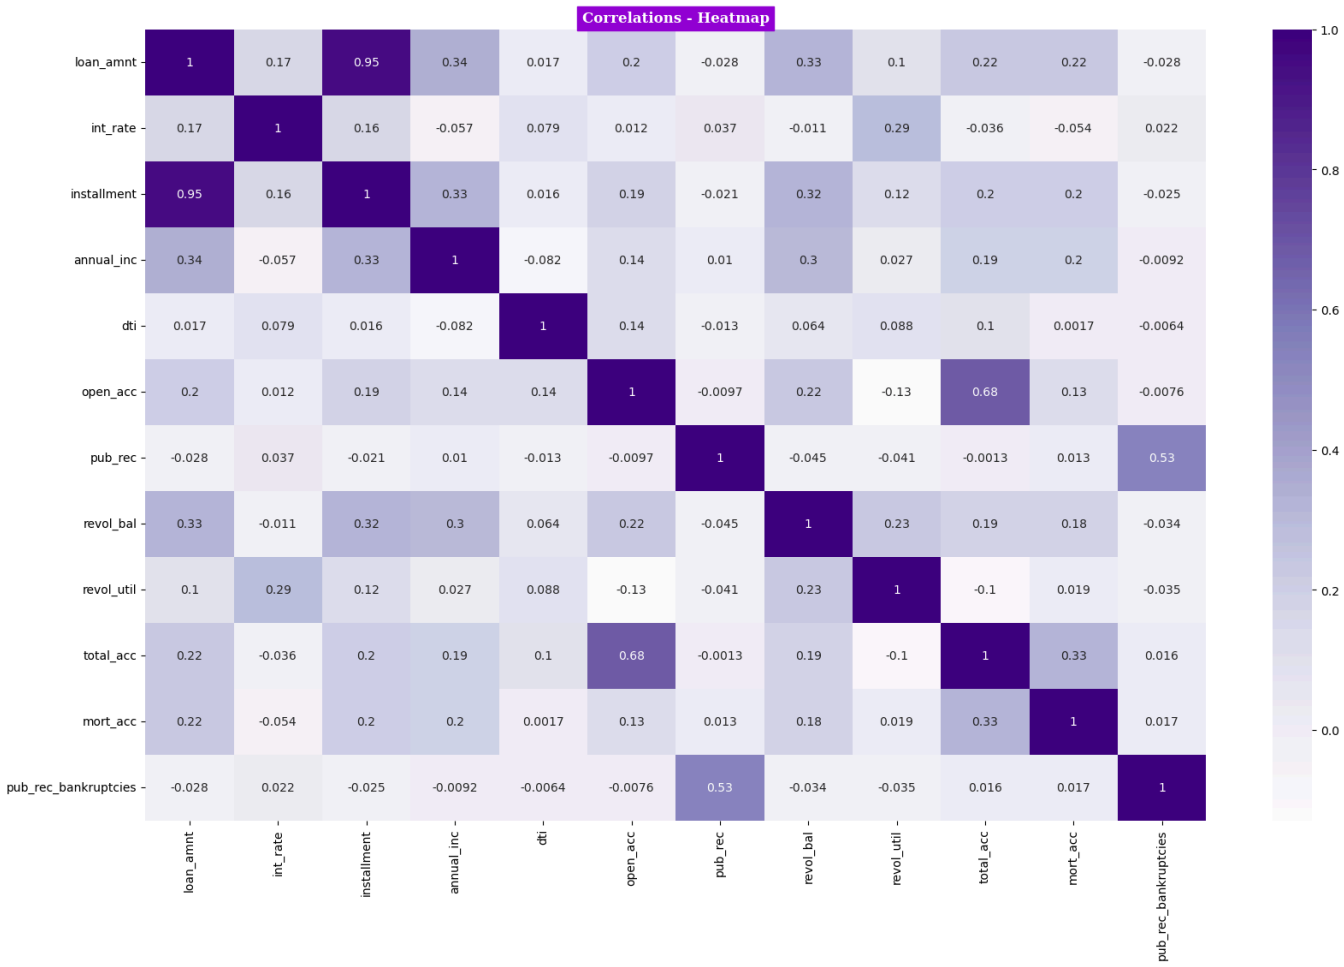
```
df.groupby('emp_title')['loan_status'].count().sort_values(ascending=False).to_frame()[1:6]
```

	loan_status
emp_title	
Teacher	4389
Manager	4250
Registered Nurse	1856
RN	1846
Supervisor	1830

💡 Insights:

- The Most afforded job titles are `Teachers & Managers` .

```
plt.figure(figsize=(20,12))
sns.heatmap(num_cols.corr(), annot=True, cmap='Purples')
plt.title('Correlations - Heatmap',fontsize=12,fontfamily='serif',fontweight='bold',backgroundcolor=cp[2],color='w')
plt.show()
```



💡Observations:

- There exists a strong correlation between loan_amnt and installment, indicating that higher loan amounts correspond to larger installment payments.
- The variables total_acc and open_acc exhibit a significant correlation.
- There is a notable correlation between pub_rec_bankruptcies and pub_rec.

🔍Outlier Treatment:

Model-1

```
#Fit the Model on training data
logreg_model = LogisticRegression()
logreg_model.fit(X_train, y_train)
```

```
▾ LogisticRegression
LogisticRegression()
```

```
#Predit the data on test dataset
y_train_pred = logreg_model.predict(X_train)
y_test_pred = logreg_model.predict(X_test)
```

```
logreg_model.score(X_test, y_test) , logreg_model.score(X_test, y_test_pred)
```

```
(0.8935435700637454, 1.0)
```

If logreg_model.score(X_test, y_test) consistently returns 1, it would imply that your model is predicting the test set perfectly, which could be a sign of overfitting, data leakage, or an issue with the evaluation process.

```

```

🔍Observations:

- The model demonstrates a high recall score, successfully identifying 80% of actual defaulters.
- However, the precision for the positive class (defaulters) is low; only 47% of predicted defaulters are actually defaulters.
- This high recall and low precision indicate that while the model is effective at flagging most defaulters, it also results in many false positives. Consequently, many deserving customers may be denied loans.
- The low precision adversely affects the F1 score, reducing it to 60%, despite an overall accuracy of 80%. This highlights the trade-off between precision and recall in the model's performance.

Explanation :

- The model is good at catching most people who don't pay back their loans it catches 80% of them.
- But, when it says someone won't pay back, it's right only half of the time.47% So, there's a chance it's making mistakes and wrongly flagging people.
- Because of these mistakes, some people who deserve loans might not get them.
- Even though the model seems okay overall, its balance between being right and not making mistakes isn't great. It's like a seesaw; when one side goes up, the other goes down.

Regularization Model

```
#Try with different regularization factor lamda and choose the best to build the model

lamb = np.arange(0.01, 10000, 10)

train_scores = []
test_scores = []

for lam in lamb:
    model = LogisticRegression(C = 1/lam)
    model.fit(X_train, y_train)

    tr_score = model.score(X_train, y_train)
    te_score = model.score(X_test, y_test)

    train_scores.append(tr_score)
    test_scores.append(te_score)

#Plot the train and test scores with respect lambda values i.e. regularization factors
ran = np.arange(0.01, 10000, 10)

Observations from classification report:

> Regularized model

- Precision : 89%
- Recall : 100%
- F1-score : 94%
- Accuracy : 89%

🔷K-fold - Cross_validation

- cross validation accuracy has to be approx 89%

```
x=scaler.fit_transform(X)

kfold = KFold(n_splits=10)
accuracy = np.mean(cross_val_score(reg_model,x,y,cv=kfold,scoring='accuracy'))
print("Cross Validation accuracy : {:.3f}".format(accuracy))
```

```
Cross Validation accuracy : 0.894
```

```
cm = confusion_matrix(y_test, y_reg_pred)
cm_df = pd.DataFrame(cm, index=['Defaulter','Fully paid'], columns=['Defaulter','Fully paid'])
cm_df
```

	Defaulter	Fully paid
Defaulter	5223	6455
Fully paid	151	50450

💡 Insights:

- TN = 5223 (True Negative: Correctly predicted Charged Off)
- TP = 50450 (True Positive: Correctly predicted Fully Paid)
- FP = 6455 (False Positive: Predicted Fully Paid but actually Charged Off)
- FN = 151 (False Negative: Predicted Charged Off but actually Fully Paid)
- Actual Negative (Charged Off) = 5223 + 6455 = 11678
- Actual Positive (Fully Paid) = 151 + 50450 = 50601
- Predicted Negative (Charged Off) = 5223 + 151 = 5374
- Predicted Positive (Fully Paid) = 6455 + 50450 = 56905

```
#Collect the model coefficients and print those in dataframe format
coeff_df = pd.DataFrame()
